

Various instabilities up high

Date

Wed, 04/23/2025 - 05:40

Activity

Skiing

Toured out of beehive basin yesterday (4/22). I spotted a storm slab avalanche on a northeast-facing slope at 9400 ft. It was fairly far away, but the debris pile was decently sized. While skiing a northwest aspect in the high alpine, I pulled out several small wind slab pockets, including one that propagated about 10 ft and was a foot or so deep. These slabs were beginning to set up and weren't super touchy. Later in the day, I saw a small point release originating from an east-facing rock band at around 10000 ft.

Region

Northern Madison

Location (from list)

Beehive Basin

Observer Name

Jay Alford
